

Exercises on pointers

Implement the following functions together with a testing main.

1. minimum between numbers.

Define a function that given two integer variables (passed through their pointers) returns the pointer to the variable holding the smaller value, or `NULL` (the null pointer value) if they hold the same value

```
int * min(int *a, int *b)
```

2. fraction's normal form

Define a function that, given two integer variables representing the num and den of a fraction (passed through their pointers), reduces the fraction to its normal form by dividing num and den by their greatest common divisor (use the Euclidean algorithm)

```
void normalize(int *n, int *d)
```

3. next date

Define a function that, given three positive integers representing a date (passed through their pointers), calculates the date corresponding to the day after

```
void nextDate(unsigned *month, unsigned *day, unsigned *year)
```
